## Stormwater Green Infrastructure: A Decorative Innovation

**Green Infrastructure** is an approach to stormwater management that reduces the volume of polluted runoff from entering our streams and pipe systems. The capturing of the first one inch of rainfall slowing and cleaning the stormwater runoffs.

The City of Perry utilizes the Permeable pavers are a sustainable alternative to traditional paving or impermeable surfaces. Pervious pavements are designed to allow infiltration of stormwater through the surface and into the soil below where the water is naturally filtered, and pollutants are removed. The Permeable paver system is used in the downtown district to help reduce the amount of runoff that enters our waterways which in turn prevents contamination and prevents erosion. These decorative stormwater BMPS have longer expectancy.
